

MultiValue Central and Aptron Announce New Partnership

July 28, 2026 — MultiValue Central (MVC) today announced a new partnership with Aptron Corporation, bringing together MVC's professional services expertise with Aptron's mvQuery reporting solution to give organizations running MultiValue databases more complete access to the tools and expertise they need to modernize and get more value from their systems.

What the Partnership Means

As part of the agreement, MVC can now offer mvQuery, a query, report design, and data export tool purpose-built for MultiValue databases, as part of the solutions it offers, giving organizations a solid, modern reporting option without the cost or delay of custom development. mvQuery has served as the reporting engine inside Aptron's Collegix platform for more than 20 years and is already distributed globally through a network of independent software vendors.

The partnership also opens the door for closer collaboration between the two companies going forward, including opportunities for Aptron to connect organizations that could benefit from MVC's modernization, migration, and advisory services.

"This partnership gives us another strong option to bring into the conversations we're already having with clients," said John Nunziato, founder and President of MultiValue Central. "mvQuery provides a budget-friendly, proven reporting tool that fits naturally alongside the modernization and advisory work we do every day."

"MultiValue Central understands this platform inside and out, and that makes them a natural partner," said Tom Makosky, President of Aptron. "This relationship gives us a way to support organizations that need more than reporting software, and gives both of our teams a better window into what the other offers."

Why it matters

MultiValue databases run mission-critical operations for organizations worldwide, but modern reporting has long been a weak spot for many of them. This partnership gives MultiValue Central a strong reporting option to bring into client conversations, and strengthens the working relationship between the two companies as they continue to explore how their products and services complement each other.

About mvQuery

mvQuery is an easy-to-use query, report designer, and data export tool built for MultiValue databases. It's been the workhorse reporting engine behind Aptron's Collegix product for over 20 years and is distributed worldwide through a network of independent software vendors and other distributors.
